Anlagenbuch — Quick Reference

This guide targets daily use. It describes **what to enter where** and **how the typical workflows run** — not every single field. Self-explanatory fields are skipped; only fields that influence sorting, filters, downstream processes or reports are explained.

For readers in a hurry, two menu entries under “**Anlagenbuch**” are enough — everything else is reachable from there:

- **Asset** — the record of a single asset. This is where defects are reported, sightings logged and schedules planned.
- **Work Order** — what we let a workshop handle.

1. Terminology (the essentials in one paragraph)

An **asset** is anything that should have a record — truck, car, forklift, roller door, fire extinguisher, hand truck. Every asset belongs to an **asset class** (e.g. “Truck 12 t+”), and every class has a **category** (Vehicle, Equipment, Stationary, Building, IT, Other) — the category determines which fields the form displays.

Three kinds of **items** are kept against an asset:

Item	When	Document No
Defect	A defect has been observed	FEH-...
Schedule	An appointment is planned or due (TÜV...)	TER-...
Status	A sighting without any defect	STA-...

Multiple items are bundled into a **work order** (WAU-...) when the asset goes to a workshop.

2. Daily workflows

2.1 A defect is reported

Inbound: a driver or colleague calls or stops by.

1. Open menu **Anlagenbuch** → **Asset**, find the reported asset.
2. Tab **Defect**, new record.
3. **Required**: short description, date, priority.
4. Useful as soon as known: reporter, meter reading, cost estimate, long description.
5. Save. Status stays **Open** until the defect is resolved or pulled into a work order.

Important only for reports and filters:

- **Priority** controls the sort order in the asset dossier and the workshop dossier. High = top.
- **Reported date** is the sort key in the history. If the defect is older than the data entry, use the real date.

2.2 An asset goes to the workshop

1. Menu **Anlagenbuch** → **Work Order**, new record.
2. In the upper block “**Order preparation**” fill in: asset, workshop, driver, internal contact, scheduled date.
3. **Save** (otherwise the system doesn’t yet know which asset this is about).
4. Press the button “**Pull open items**” — the open defects and overdue schedules of the asset are entered automatically.
5. In the detail tab **Items** delete or untick (**IsResolved=N**) what should **not** go to the workshop this time.
6. Use the print button in the work order’s toolbar to print the **workshop dossier** — that’s the paper that physically travels with the asset.

2.3 Return from the workshop

1. Open the matching work order.
2. Fill in the lower block “**After return**”: return date, actual cost, document number (invoice).
3. In tab **Items** check what was actually done — untick (**IsResolved=N**) the items that were not completed.
4. **Set status to “Completed”**. This triggers:
 - all ticked defects are set to **Done**;
 - for every completed schedule a **follow-up schedule** is automatically proposed;
 - unchecked items stay open and reappear next time you “Pull open items”.

2.4 Completing a maintenance schedule individually

Some schedules don’t need a work order (e.g. an internal visual check). In that case:

1. Open the asset, tab **Schedule**, pick the item.
2. Enter a **completion date**, set status to **Done**, save.
3. The system creates the **follow-up schedule** automatically, dated to the first of the month of the completion date plus the default interval of the schedule type. **Adjust the date if the workshop or authority sets a different one** — TÜV is rarely exactly 12 months in practice.

2.5 Logging a sighting (status report)

Purpose: a gapless history, even when nothing is wrong. Use it for the **initial intake of a new asset**, for **handovers between drivers**, and for **regular sightings**.

1. Open the asset, tab **Status**, new record.

2. Date, short description (“Visual check, dispatcher”), meter reading. Save — the entry is stored as Done immediately.

2.6 Creating a new asset

1. Menu **Anlagenbuch** → **Asset**, new record.
2. Pick the **asset class** — it controls UI behaviour, the standard schedule types and the unit of measure for meter readings.
3. At minimum, fill **Value** (short identifier, e.g. license plate) and **Name**. The rest of the master data can come later.
4. In tab **Schedule** enter the first mandatory schedules (TÜV, UVV...). Follow-up schedules will be created automatically from the first completion.
5. In tab **Status** record the current state at intake (meter reading, general impression).

2.7 Decommissioning an asset

Sold, scrapped, retired — the asset should no longer appear in reports, but the record should be preserved.

1. Open the asset.
2. Untick **Active** (IsActive=N).
3. Save. The asset no longer shows up in the standard filters; the record is still reachable via the “Show all” search.

3. Reports — when to use what

Three standard reports, all reachable via the print icon in the respective window’s toolbar or via the menu:

Report	Invoked from ...	Purpose
Workshop Dossier	Work Order	Physically travels to the workshop; receipt on return.
Asset Dossier	Asset	Master data, upcoming schedules, open defects, history.
Asset Status List	Anlagenbuch menu	Fleet-wide list, filtered by class, only assets with open items.

The overview is the tool for the weekly review in dispatch.

4. Small things people ask repeatedly

- **Who is “Reporter” and who is the “creator”?** Reporter = the person who reported the defect. Whoever fills in the form (usually the dispatcher) is recorded by iDempiere as the creator automatically — don’t enter that separately.
- **Meter reading on every item?** Yes, if you can read it without effort. Even the status report benefits — it provides the only reliable meter readings between workshop visits.
- **Picked the wrong asset?** Deleting and re-creating the item is usually easier than moving it to a different asset.
- **“Mandatory” vs “Optional”?** It is set on the **schedule type**, not on the individual schedule — TÜV is always mandatory, a warranty reminder is always optional.

5. What the system does not (yet) do

- No driver app: defects continue to arrive verbally or by phone, the dispatcher types them in.
- No automatic pre-generation of recurring schedules — the follow-up schedule is only created once the current one is saved as Done.
- No KPIs / statistics in the first version. They will follow once there is enough data.
